Documentation for the SUNFLO crop model April 27, 2015

Abstract

SUNFLO is a process-based model for the sunflower crop which was developped to simulate the grain yield and oil concentration as a function of time, environment (soil and climate), management practice and genetic diversity (Casadebaig et al., 2011; Debaeke et al., 2010; Lecoeur et al., 2011).

This model is based on a conceptual framework initially proposed by Monteith (1977) and now shared by a large familly of crop models [REF]. In this framework, the crop dry biomass growth rate (dDM/dt) is calculated as an ordinary differential equation [EQ1] function of incident photosynthetically active radiation (PAR, $MI.m^{-2}$), light interception efficiency $(1 - exp^{-k \cdot LAI})$ and radiation use efficiency (RUE, $g.MJ^{-1}$). The light interception efficiency is based on Beer-Lambert's law as a function of leaf area index (LAI) and light extinction coefficient (k). The radiation use efficiency concept (Monteith, 1994) is used to represent photosynthesis at the crop scale.

[EQ1]
$$dDM/dt = RUE \cdot (1 - exp^{-k \cdot LAI}) \cdot PAR$$

Broad scale processes of this framework, the dynamics of LAI, photosynthesis (RUE) and biomass allocation to grains were split into finer processes (e.g leaf expansion and senescence, response functions to environmental stresses) to reveal genotypic specificity and to allow the emergence of genotype x environment interactions. Globally, the SUNFLO crop model has about 50 equations and 64 parameters (43 plant-related traits and 21 environment-related).

ElongationRate	Reciprocal of hypocotyl elongation rate	1.19	$Cd.mm^{-1}$	(Villalobos et al., 1996)

Emergence

Emergence = Germination + ElongationRate * SowingDepth

- *Germination* = 86, Thermal time for germination (°C.d);
- *ElongationRate* = 1.19, Hypocotyl elongation rate (°Cd/mm)
- SowingDepth = 30, Sowing depth (mm).

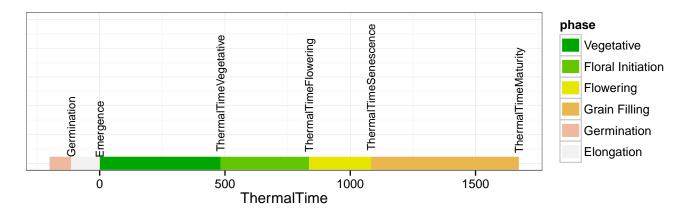

ThermalTime

$$ThermalTime_d = \left\{ egin{array}{ll} \int_0^d \left(T_m - T_b
ight) * \left(1 + WaterStressPhenology
ight) & ext{if } T_m > T_b \\ 0 & ext{else} \end{array}
ight.$$

with:

- *T_m*, Daily mean air temperature (°C);
- $T_b = 4.8$, Basal temperature (°C) (Granier and Tardieu, 1998);
- Thermal Stress Phenology, Water stress effect on plant heating

PhenoStages

In the software model, phenostages are computed as integers $\in [0,7]$ corresponding to duration between key stages:

- o, begining of simulation sowing (bare soil)
- 1, sowing (Ao) emergence (A2)
- 2, emergence (A2) floral initiation (E1)
- 3, floral initiation (E1) flowering (F1)
- 4, flowering (F1) onset of senescence (Mo)

- 5, onset of senescence (Mo) maturity (M3)
- 6, maturity (M₃) harvest
- 7, harvest end of simulation (bare soil)

LeafArea

label	description	value	unit	reference
PotentialLeafNumber	Potential number of leaves at flowering	29.00	leaf	(Lecoeur et al., 2011)
PotentialLeafProfile	Potential rank of the plant largest leaf at flowering	17.00	leaf	(Lecoeur et al., 2011)
PotentialLeafSize	Potential area of the plant largest leaf at flowering	448.00	cm^{-2}	(Lecoeur et al., 2011)
Phyllotherm_1	Phyllotherm (leaf <= 6)	71.43	C.d	(Rey, 2003)
Phyllotherm_7	Phyllotherm (leaf > 7)	16.34	C.d	(Rey, 2003)
PotentialLeafDuration	Thermal time between expansion and senescence	851.33	C.d	(Casadebaig, 2008)

LeafInitiationTime, LeafExpansionTime, LeafSenescenceTime

$$\textit{Leaf InitiationTime}_i = \left\{ \begin{array}{ll} i*\textit{Phyllotherm}_1 & \text{if } i \leq 6 \\ (i-5)*\textit{Phyllotherm}_7 + a & \text{if } i \leq \textit{Leaf Number} \end{array} \right.$$
 with:

- *Phyllotherm*₁ = 76.43 (°C.d)
- $Phyllotherm_7 = 16.34$ (°C.d)
- $a = 400 \, (^{\circ}\text{C.d})$

 $LeafExpansionTime_i = LeafInitiation_i + 1/a$ with a = 0.01379.

LeafExpansionDuration

 $-(i-PotentialLeafProfile)^2$ $LeafExpansionDuration_i = a + PotentialLeafDuration * exp^{\frac{1}{(c*PotentialLeafNumber)^2}}$

- PotentialLeaf Duration = 851.3 (°C.d)
- $a = 153 \, (^{\circ}\text{C.d})$
- b = 0.78

 $LeafSenescenceTime_i = LeafExpansionTime_i + LeafExpansionDuration_i$

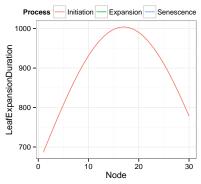

PotentialLeafArea

 $Potential Leaf Area_i = Potential Leaf Size * exp^{a*(\frac{i-Potential Leaf Profile}{Potential Leaf Profile-1})^2 + b*(\frac{i-Potential Leaf Profile}{Potential Leaf Profile-1})^3}$ with: * a = -2.05 and b = 0.049, shape parameters * *PotentialLeafSize* (cm2) and PotentialLeaf Profile (node), genotypic parameters.

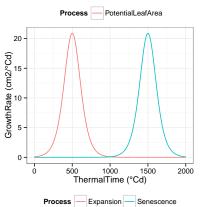

LeafGrowthRate, LeafSenescenceRate, LeafArea

$$\begin{aligned} \textit{Leaf Growth Rate}_i &= (T_m - T_b) * \textit{Potential Leaf Area}_i * a * \\ &= \underbrace{exp^{-a(Thermal Time - \textit{Leaf Expansion Time}_i)}}_{(1 + exp^{-a(Thermal Time - \textit{Leaf Expansion Time}_i))^2} \\ \\ \textit{Leaf Senescence Rate}_i &= (T_m - T_b) * \textit{Leaf Area}_i * a * \\ &= \underbrace{exp^{-a(Thermal Time - \textit{Leaf Senescence Time}_i)}}_{(1 + exp^{-a(Thermal Time - \textit{Leaf Senescence Time}_i))^2}} \end{aligned}$$

with:

- $T_m = 25$, mean air temperature (°C)
- $T_b = 4.8$, base temperature (°C)
- a = 0.01379

The illustration uses i=10 as values for $PotentialLeafArea_i$, $LeafExpansionTime_i$ and $Leaf Senescence Time_i$

$$\textit{LeafArea}_i = \int \textit{LeafGrowthRate}_i - \int \textit{LeafSenescenceRate}_i$$

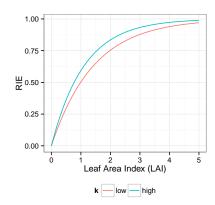

Light interception

LAI

$$LAI = SowingDensity * \sum_{i=1}^{LeafNumber} LeafArea_i$$

RIE

$$RIE = 1 - exp^{(-ExtinctionCoefficient*LAI)}$$

Biomass production

RUE

$$Potential RUE = \left\{ \begin{array}{l} r_0 \\ r_0 + 2 * \frac{ThermalTime - 300}{ThermalTimeFlowering - 300} \\ r_{max} \\ a * exp^{b*(1 - \frac{ThermalTime-ThermalTimeMaturity}{ThermalTimeMaturity - ThermalTimeSenescence})} \\ 0 \end{array} \right.$$

with:

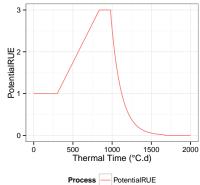

- $r_0 = 1$, vegetative RUE
- $r_{max} = 3$, maximum RUE
- a = 0.015, final RUE
- b = 4.5, slope of RUE decrease in grain filling stage

 $if\ Thermal Time < 300$

if 300 < ThermalTime < ThermalTimeFlowering

 $if\ Thermal Time Flowering < Thermal Time < Thermal Time Senescence$

 $if\ Thermal Time Senescence < Thermal Time < Thermal Time Maturity$

CropBiomass (Monteith, 1977)

dCropBiomass = Radiation * 0.48 * RIE * RUE * dt

CropPerformance

Thermal stress

ThermalStressRUE (Villalobos et al., 1996)

$$ThermalStressRUE = \left\{ \begin{array}{ll} T_m * \frac{1}{T_{ol} - T_b} - \frac{T_b}{T_{ol} - T_b} & \text{if } T_b < T_m < T_{ol} \\ 1 & \text{if } T_{ol} < T_m < T_{ou} \\ T_m * \frac{1}{T_{ou} - T_c} - \frac{T_c}{T_{ou} - T_c} & \text{if } T_{ou} < T_m < T_c \\ 0 & \text{else} \end{array} \right.$$

with:

- $T_b = 4.8$, base temperature (°C)
- $T_{ol} = 20$, optimal lower temperature (°C)
- $T_{ou} = 28$, optimal upper temperature (°C)
- $T_c = 37$, critical temperature (°C)

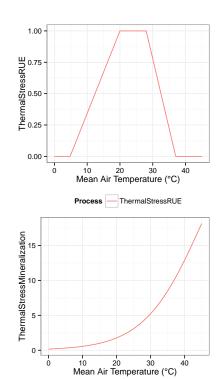

ThermalStressMineralization (Valé et al., 2007)

$$\textit{ThermalStressMineralization} = \frac{T_c}{1 + (T_c - 1) * exp^{(-0.119*(T_m - T_b))}}$$

with:

- $T_b = 15$, base temperature (°C)
- $T_c = 36$, critical temperature (°C)

ThermalStressAllocation

Process — ThermalStressMineralization

Water stress

WaterDemand

$$WaterDemand = K_c * PET * RIE$$

with $K_c = 1.2$, crop coefficient

WaterSupply

$$WaterSupply = Rainfall + Irrigation - Transpiration - Evaporation - Drainage$$

Transpiration = WaterDemand * WaterStressConductance

$$Evaporation = (1 - RIE) * PET * SoilConductivity$$

SoilConductivity =
$$\sqrt{x+1} - \sqrt{x}$$

with

$$dx/dt = \left\{ egin{array}{ll} 1 & \mbox{if $Rainfall+Irrigation} <= 4 \\ 0 & \mbox{else} \end{array} \right.$$

WaterStress

$$WaterStress = \frac{WaterAvailable}{WaterTotal}$$

Water Available = Water Supply

WaterTotal = SoilWaterCapacity * SoilDensity * (1 - StoneContent) * RootingDepth

WaterStressExpansion, WaterStressConductance

$$WaterStressProcess = -1 + \frac{2}{1 + exp^{(a*WaterStress)}}$$

with $a \in [-15.6; -2.3]$, genotype-dependant response parameter

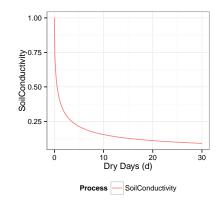

WaterStressPhenology

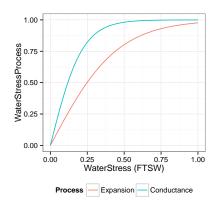

WaterStressPhenology = a * (1 - WaterStressConductance)

with a = 0.1, scaling parameter for water-stress plant heating

WaterStressMineralization

 $WaterStressMineralization = 1 - (1 - y_0) * (1 - RelativeWaterContent_{layer1})$

Nitrogen stress

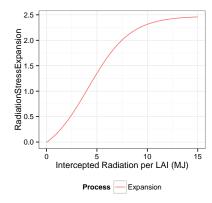

Radiation stress

RadiationStressExpansion (Rey, 2003)

$$RadiationStressExpansion = s*a + \frac{b}{1 + exp^{\left(\frac{c - IPAR/LAI}{d}\right)}}$$

with:

- s = 2.5, scaling parameter for density effect;
- a = -0.14; b = 1.13; c = 4.13; d = 2.09
